

▪ LL/2 cells

Lewis lung carcinoma is a cell line established from the lung of a C57BL6 mouse bearing a tumor resulting from an implantation of primary Lewis lung carcinoma.

▪ Tumour growth *in vivo*

The cells were collected from a tissue culture flask and injected subcutaneously in the right flank of C57Bl/6 mice. The resulting tumours were monitored by weighting the mice.

The mice bearing LL/2 tumours can be treated by intra-peritoneal, intra-venous, intra-tumoral or subcutaneous injection of the compounds. Per os administration is also possible.
